Movies Analytics using Azure Data Factory

Problem Statement

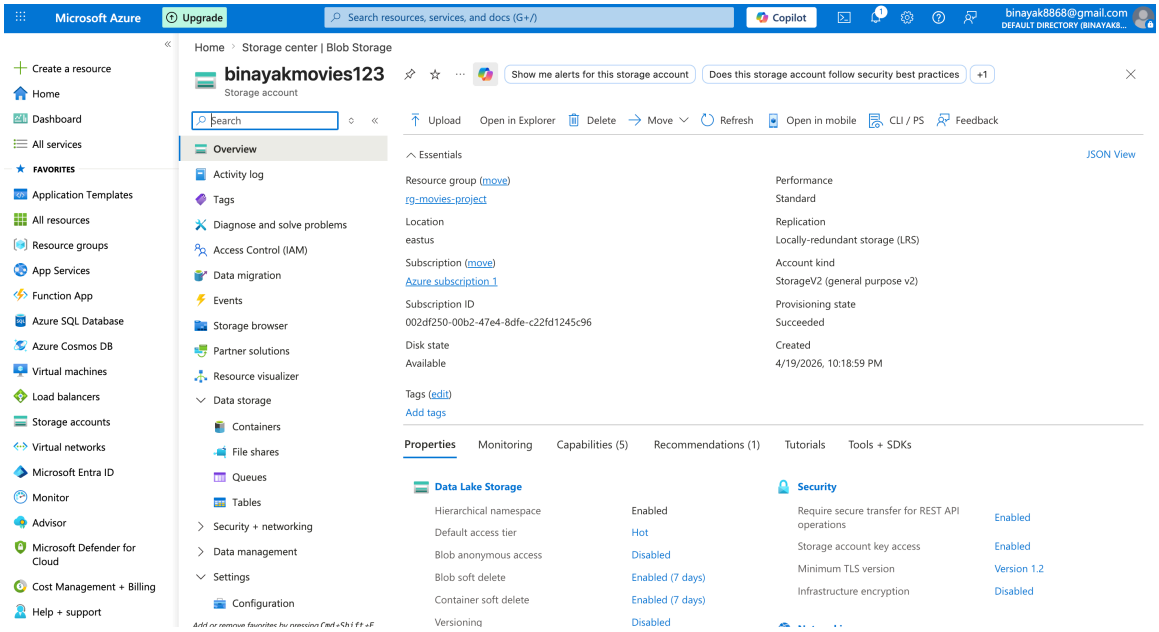
Use Azure Data Factory to move movie data from Azure Data Lake Storage Gen2 to Azure SQL Database and create transformed analytics output.

Completed Tasks

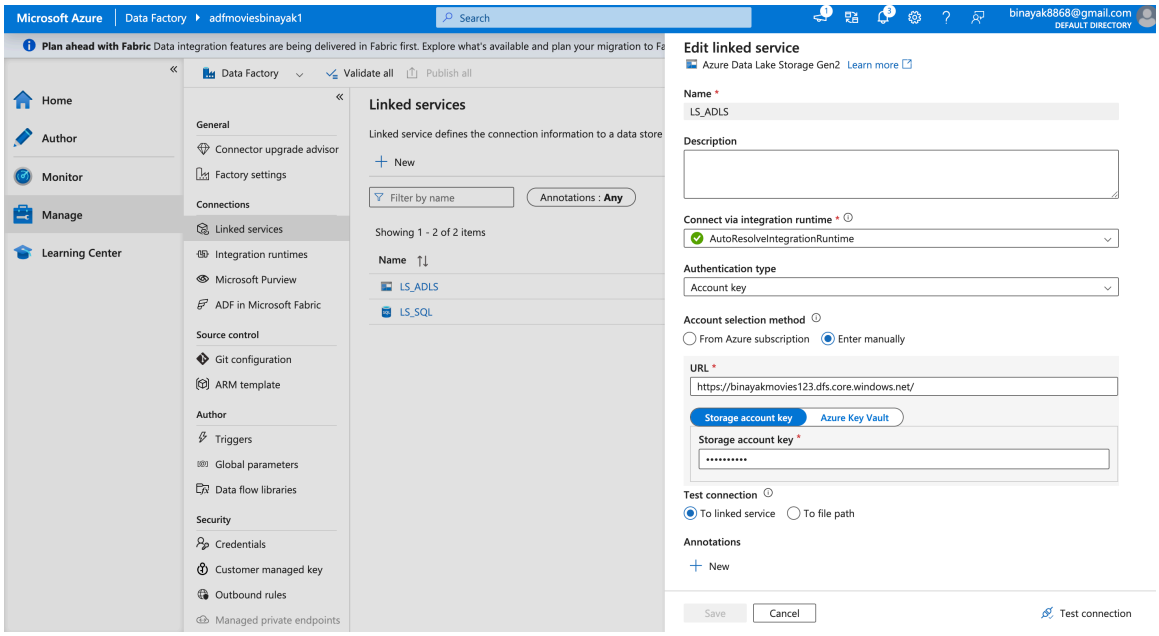
- Created azure-project container
- Uploaded movies.csv and ratings.csv
- Created linked services LS_ADLS and LS_SQL
- Created datasets
- Built copy pipelines
- Loaded dbo.movies and dbo.ratings tables
- Prepared final genre analytics table Test.generes

Required Screenshots

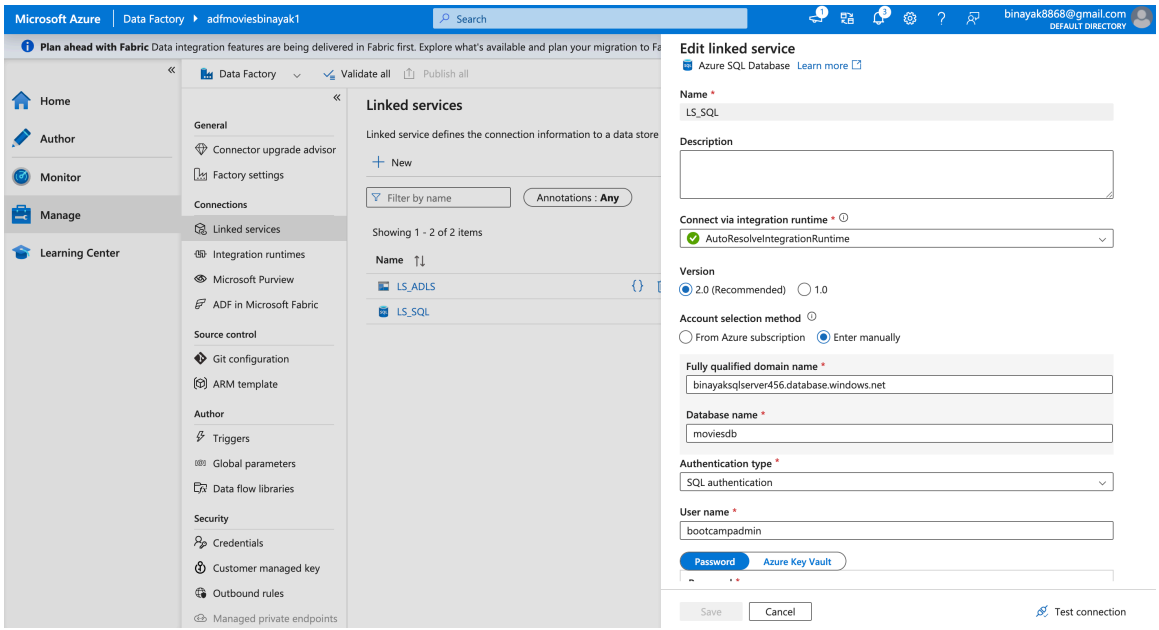
1. Data lake container azure-project



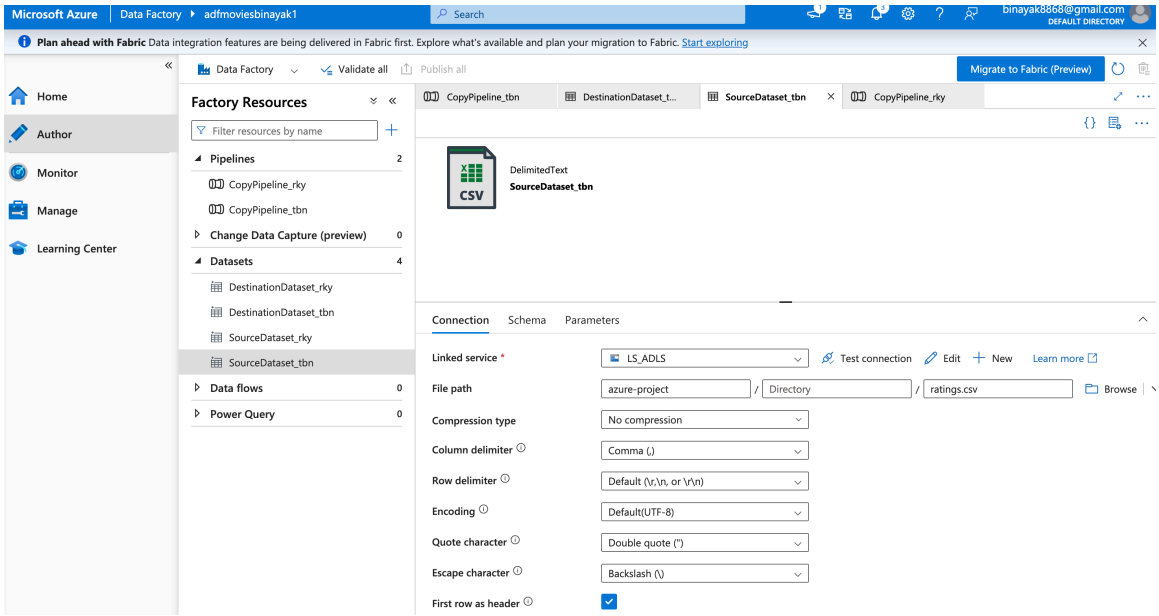
2. Linked service LS_ADLS



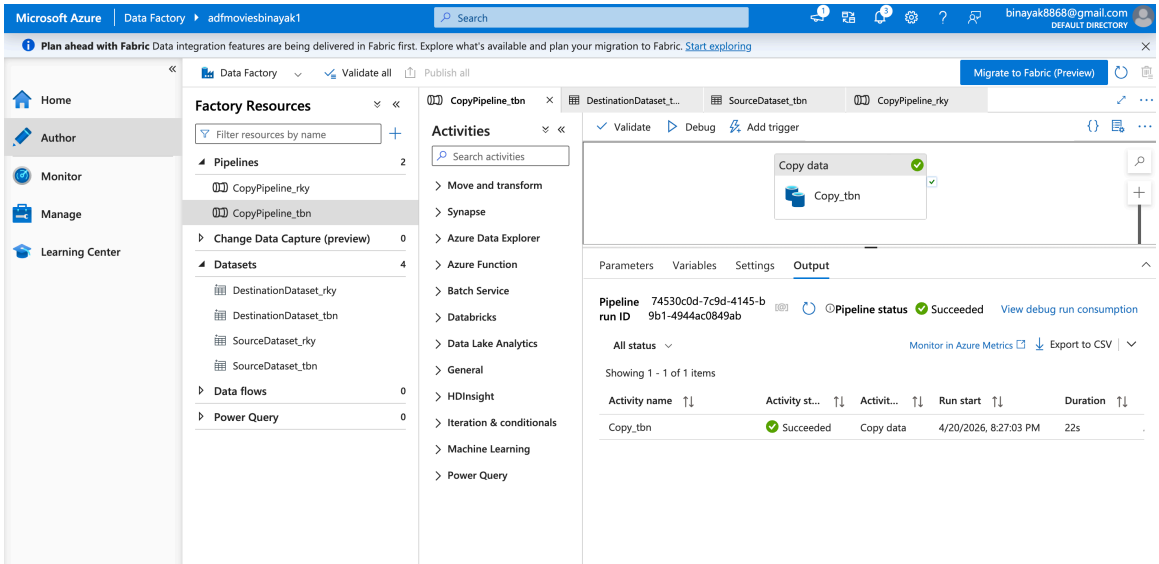
3. Linked service LS_SQL



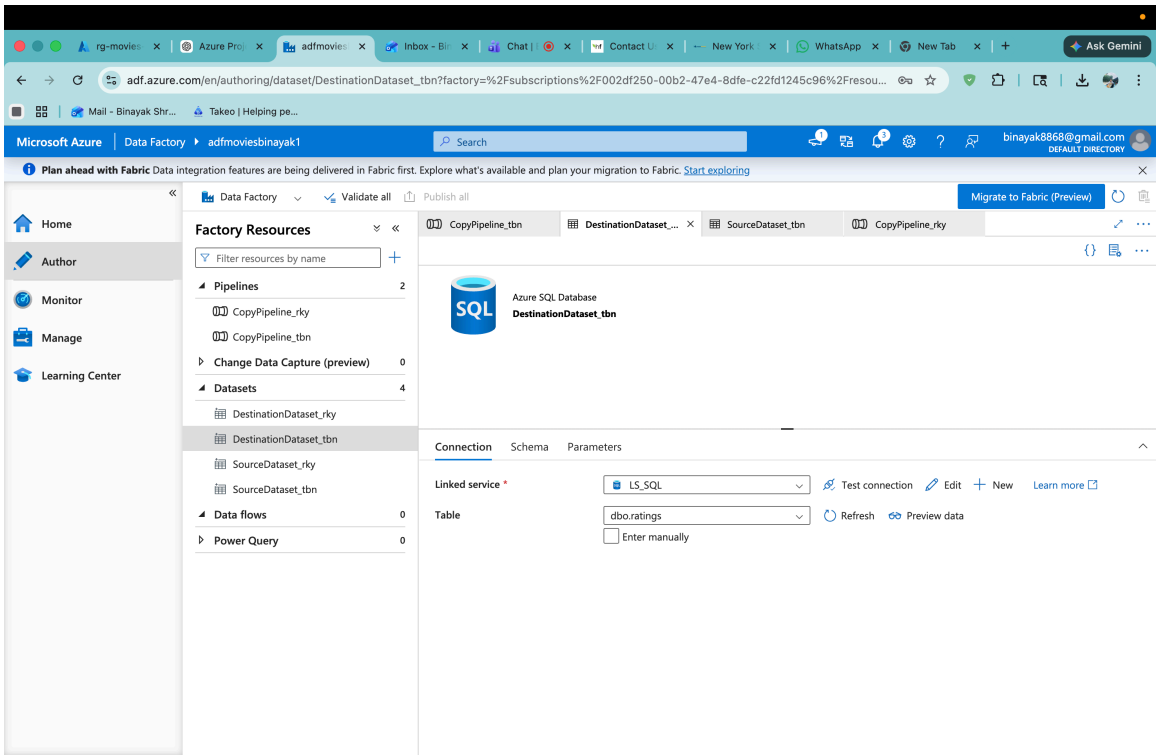
4. Datasets list



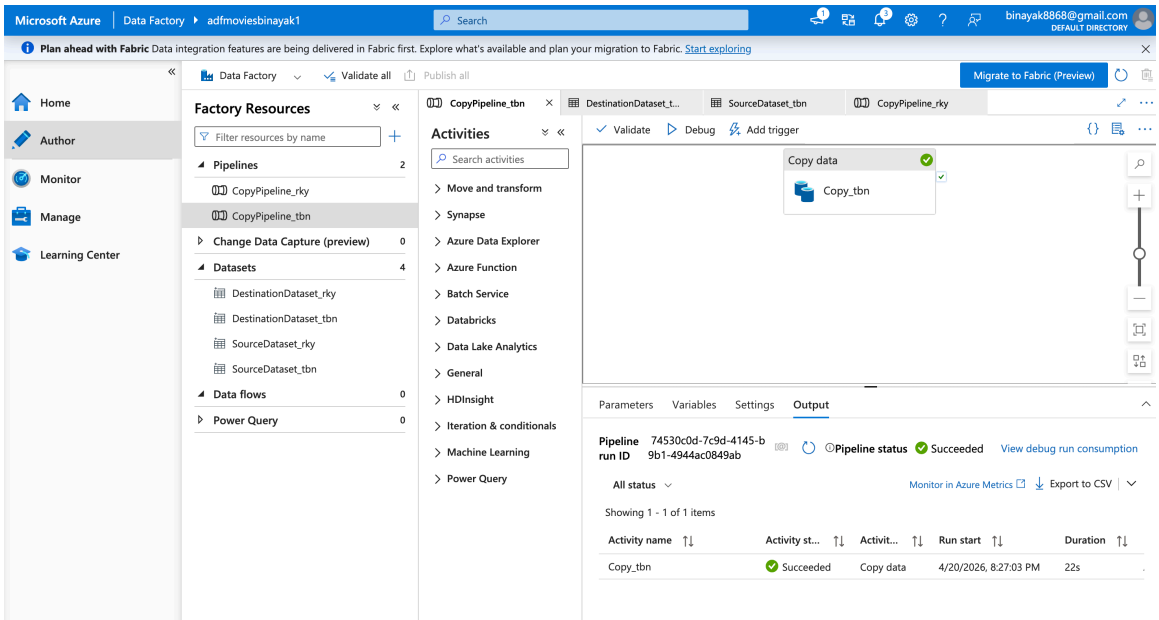
5. Pipeline with activities



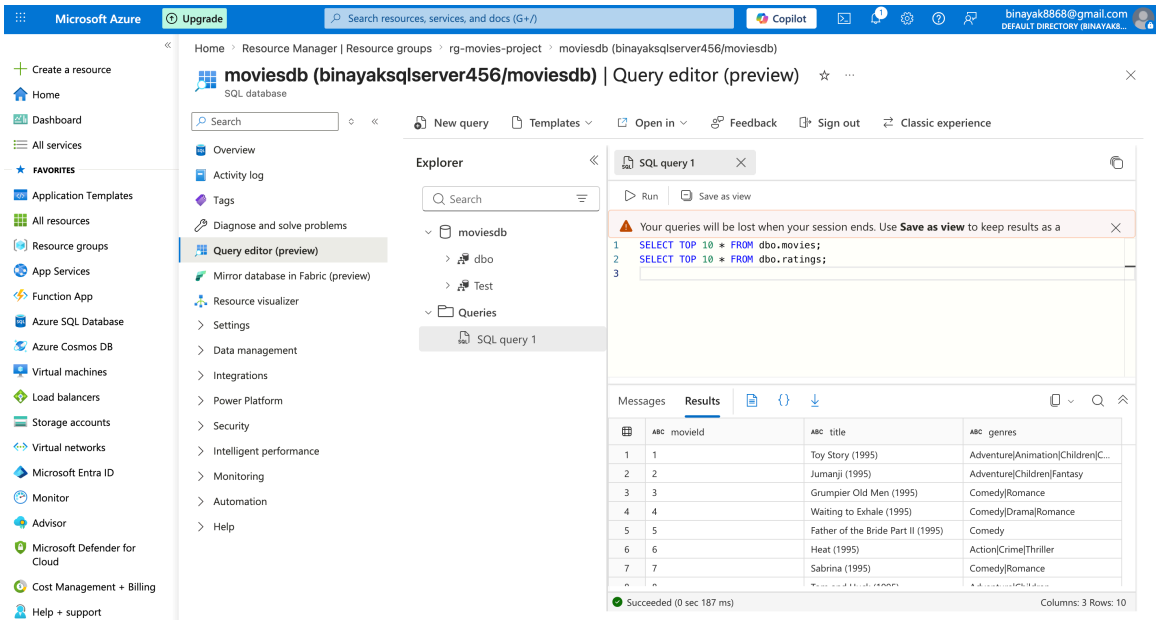
6. Data flow transformation



7. Succeeded pipeline run



8. Final SQL table output: SELECT * FROM Test.generes



Conclusion

This project demonstrates a complete ETL workflow using Azure cloud services for data ingestion, orchestration, transformation, and reporting.
